

Data and Activity Summary

- The following slides demonstrate the constituency impact on the 4 local areas based on our 2 proposals
- We have looked at services currently provided in Walk in Centres and Minor Injury Units and determined what % of these could be treated by a GP, Nurse or Pharmacist
- Generally, services provided are very similar to those available at local pharmacies and in some cases, the pharmacies are on the same site meaning that patients would not be travelling any further to be seen
- For the Arrowe Park site we have demonstrated that the proposed options would mean for option 1, an additional 37 people per day would present to the site and for option 2, an additional 27 people per day.

Conclusions

- We know that there is an inequity of provision of urgent care across Wirral
- There are variable services with differing costs associated to them
- Despite investing in Walk in Centres and Minor Injury Units, A&E attendances have not reduced
- Our research illustrates that we are not always using NHS resources as efficiently or effectively as possible – for example, GP and Nurses are dealing with concerns that a Pharmacist could actually deal with
